

Name: Marie Antonete D. Rodrigo

Activity Title: "Handmade Flower Bouquet System"

1. System Description

The Handmade Flower Bouquet Management System is a specialized platform designed for a craft business to manage custom orders for chenille stem (fuzzy wire) flower arrangements. It allows the business owner to keep track of available materials, such as different colors of wire and ribbons, while enabling customers to place orders for specific flower types like tulips or lilies. The system serves as a central hub where orders are processed, payment statuses are updated, and delivery schedules are organized. By digitizing these records, the system ensures that no customer request is missed and that material stock levels are always accurate for production.

2. System Components

Actors/Users

Customer: Browses available flower designs and places custom orders.

Owner/Admin: Manages inventory, updates order status, and views sales reports.

Main System Functions

Order Management: Create, update, and track status of flower bouquet orders. Inventory

Tracking: Monitor stock levels of fuzzy wires, stems, and wrapping paper.

Product Cataloging: List different bouquet types (e.g., Solo Tulip, Mixed Lily Bouquet) and their prices.

Payment Processing: Log and verify customer payments.

4. Short Explanation

The Use Case Diagram illustrates the functional requirements of the system by showing how different users interact with specific features. It clearly defines the roles of the Customer and the Owner, ensuring that the system logic covers both the purchasing and the management sides of the business. This design ensures the system is complete and addresses the core needs of a small-scale floral craft operation.
